

Configuration kit (VVI740 + SCM700C)

VVK700C

The SCM700C is a software tool for the programmable seismic detectors VVS700 series. With this program you can adapt the seismic detector to all the different types of object that you want to protect. You have 100% flexibility with only one detector that you can program to apply to different material, environments, etc.

The configuration cable VVI740 enables the VV700 series seismic detectors and the computer to communicate. A serial communication port, RS232, is required on your laptop. The cable is the only installation tool the installer needs when configuring the detector.

Specifications

VVI740

Serial communication port	RS232
---------------------------	-------

SCM700C

Program requirements	Windows 95,98, NT or 2000
----------------------	---------------------------

Ordering Information

VVK700C	Configuration kit (VVI740 + SCM700C)
---------	--------------------------------------

- One configuration cable for all installation
- Special configuration software for the VVS700 series
